There is currently no book on the market that has a case-study focus and builds e-commerce sites using the new Microsoft Visual Studio .NET Framework. In addition, many of the books that are likely to be released in the near future won't target the intermediate to advanced developer. *Building e-commerce Sites* describes the steps a developer will take to plan, develop and deploy an actual robust, scalable e-commerce application using the Microsoft Visual Studio .NET. There are detailed descriptions of design choices a developer makes, implementation details. The author's first hand experience will save the reader time and effort. Finally, the development of a working, modern e-

commerce site is provided, in this case study approach, along with clear and simple explanations, screenshots, and step-by-step code excerpts.

Field experts Cristian Darie and Karli Watson will teach you to build e-commerce websites using ASP.NET technology. The authors walk you comfortably through the process from design to deployment and illustrate a complete e-commerce programming solution. You will learn to make use of third-party shopping-cart and payment facilities (especially suitable for small e-commerce operations). Further into the book, you will learn to supplement your site with greater functionality, eventually crafting a complete online shopping and order processing system. This book teaches by example and features real-world code. Also

included are updates for Visual Studio .NET 2003, and .NET 1.1. Upon reading this book, you will be able to quickly design and run a fully functioning online store. Further, you'll learn techniques to maintain flexibility in your site's design, so it can grow right along with your business.
