The Standard Template Library (STL) is a set of C++ template classes to provide common programming data structures and functions such as lists, stacks, arrays, etc. It is a library of container classes, algorithms, and iterators. It is a generalized library and so, its components are parameterized. A working knowledge of template classes is a prerequisite for working with STL.

Introduction to the Standard Template Library. The Standard Template Library, or STL, is a C++ library of container classes, algorithms, and iterators; it provides many of the basic algorithms and data structures of computer science. The STL is a generic library, meaning that its components are heavily parameterized: almost every component in the STL is a template. You should make sure that you understand how templates work in C++ before you use the STL.

The Standard Template Library: Introduction

The Standard Template Library is a software library for the C++ programming language that influenced many parts of the C++ Standard Library. It provides four components called algorithms, containers, functions, and iterators. The STL provides a set of common classes for C++, such as containers and associative arrays, that can be used with any built-in type and with any user-defined type that supports some elementary operations. STL algorithms are independent of containers, which significantly re

Standard Template Library - Wikipedia

The Standard Template Library (STL) is the heart of the C++ standard library. There is no official definition of the STL, however, generally accepted definition may be this: The STL is the parts of C++ Standard Library what work with iterators. So, it includes the containers, part of the iostream libraries, function objects, and algorithms.

C++ Tutorial: Standard Template Library - 2020

Standard Template Library (STL) is a collection of standard C++ template classes. It consists of generic methods and classes to work with different forms of data. Standard Template Library is basically a generic library i.e. a single method/class can operate on different data types. So, as understood, we won't have to declare and define the same methods/classes for different data types.

List in C++ Standard Template Library (STL) List in C++ Standard Template Library (STL) □ Lists in C++ Standard Template Library (STL) are containers that allow non-contiguous memory allocation. □ As compared to vector, list has slow traversal, but once position has been found, insertion and deletion are quick. □ Normally, in STL, when we say a List, we are talking about Doubly Linked List. For implementing a singly linked list, we use forward_list.

List in C++ Standard Template Library (STL)

1 Introduction The Standard Template Library provides a set of well structured generic C++ components that work together in a seamless way. Special care has been taken to ensure that all the template algorithms work not only on the data structures in the library, but also on built-in C++ data structures.
