Introductory and capstone experiences in the undergraduate psychology program are crucial ways to engage students in their major and psychology department, impart realistic expectations, and prepare them for life beyond college. Providing the right orientation and capstone courses in psychology education is increasingly a concern of instructors, department chairs, program directors, and deans, and both types of courses have become important sources for gathering pre- and post-coursework assessment data for degree learning outcomes. The strategies presented here

have been designed to help educators examine issues around teaching the introductory or careers course and developing a psychology-specific orientation program. The authors also provide concrete suggestions for building capstone experiences designed to fit the needs of a department, its pedagogical philosophy, or the educational agenda of the college or university. Undergraduate psychology curriculum designers and instructors can benefit from learning innovative and effective strategies for introducing the major to first-year students and, at graduation, for bringing closure, reinforcing the overall departmental learning outcomes, and helping students apply their disciplinary knowledge in capstone experiences and postgraduate life. In this collection of articles, psychology instructors involved in the improvement of teaching and learning review the research and share their own successes and challenges in the classroom. Discussions include effective practices for helping students become acclimated to and engaged in the psychology major, application of developmental knowledge and learning communities to course design, and use of quality benchmarks to improve introductory and capstone courses. Other chapters describe innovations in the design of stand-alone courses and offer concrete advice on counseling psychology graduates about how to use what they have learned beyond their higher education experiences.

The use of technology and teaching techniques derived from technology is currently a bourgeoning topic in higher

education. Teachers at all levels and types of institutions want to know how these new technologies will affect what happens in and outside of the classroom. Many teachers have already embraced some of these technologies but remain uncertain about their educational efficacy. Other teachers have waited because they are reluctant to try tools or techniques that remain unproven or, as is often the case, lack institutional support. This book is designed to help both groups, so that those with technological expertise can extend their knowledge, while technological novices can "ramp up" at their own pace and for their own purposes. Best Practices for Technology-Enhanced Teaching and Learning brings together expert teacher-scholars who apply and assess technology's impact on traditional, hybrid or blended, or completely on-line courses, relying on technology as a teaching tool for classroom management and interaction (e.g., Blackboard, PowerPoint, student response or "clicker systems," multimedia tools), as well as student-based uses of technology largely independent of instructors (e.g., social networking on popular sites including Facebook and MySpace). Each chapter will address how technological improvements can be connected to assessment initiatives, as is now routinely advocated in psychology and social science education. The book features current scholarship and pedagogy involving innovative technology that impacts on student learning in psychology and related disciplines, focusing also on student reactions to these novel technologies, and proper assessments of how well they promote learning. This text will serve as the standard reference on emerging technologies for undergraduate instructors.

insights that help educators address challenges of coverage, integration of active learning opportunities, and ever-evolving educational technologies. The book features current scholarship and pedagogical practices regarding the teaching of introductory psychology in face-to-face, online, or hybrid environments. The editors achieve their goals through an unusual approach: inviting experienced and expert teachers of introductory psychology to describe an ongoing theme that provides structure and unity to the gateway course. Themes include broad frameworks (e.g., problem-based learning), big ideas that integrate course content (e.g., subjectivity of human experience), or particular skills and ways of thinking (e.g., quantitative reasoning).
