APES: Doubling Time (Using the Rule of 70) Calculations: Doubling Time - When a population grows exponentially, the time it takes for the population to double, called "doubling time (symbol "dt"), can be approximately calculated using the "Rule of 70," which in formula form looks like this:  $dt = 70/r$  ("r" is sometimes written as "k") where dt = doubling time (usually in years) and r (or "k") = the growth rate expressed as a percentage.

## APES Ch. 6 + 22: Human Population and Development ...

It states that to find the doubling time of a population growing at a given annual percentage rate, divide the percentage number into 70 to obtain the approximate number of years required to double. For example, at a 10% annual growth rate, doubling time is  $70 / 10 = 7$  years.

the final answer.) a. A city has a population of 50,000 in 2012. If the population of the city grows at an annual rate of 2%,

## 2017 APES Review Packet Key

$70 / \text{doubling time} = \% \text{ growth}$  For example, if you hear that the population of your town is growing by 2% per year, that means it will double in just 35 years! ( $70/2=35$ )

## Exponential Growth and the Rule of 70 | World Population ...

The Rule of 70. To determine doubling time, we use "The Rule of 70." It's a simple formula that requires the annual growth rate of the population. To find the doubling rate, divide the growth rate as a percentage into 70.  
 $\text{doubling time} = 70/\text{annual growth rate}$ .  
Simplified, it is typically written:  $dt =$
