The field of biomedical engineering has vastly expanded in the past two decades, as reflected in the increased number of bioengineering and biomaterials programs at universities. The growth of this area has outpaced the development of laboratory courses that allow students hands-on experience, since the barriers involved in creating multidisciplinary biomaterials laboratory courses are high. A Laboratory Course in Biomaterials provides a teaching tool comprehensive in scope perspective. Multidisciplinary approach Suitable for junior or senior level laboratory courses in biomaterials and bioengineering, this volume trains students in laboratory skills, data analysis, problem solving, and scientific writing. The text takes a multidisciplinary approach, integrating a variety of principles that include materials science, chemistry, biochemistry, molecular and cell biology, and engineering. Step-by-step instructions The author presents flexible modules that allow the coursework to be adapted to the needs of different departments. Each module is organized around a central theme, such as drug delivery and natural biomaterials, to enhance student comprehension. This book provides step-by-step descriptions of lab procedures, reagents, equipment, and data processing guidelines. It also includes a series of thought-provoking questions and answers following each experiment, drawn from the author ' s own experience in teaching a biomaterials laboratory course at the University of Illinois. Timely in its coverage, many of the experiments presented in the book are adapted from research papers reflecting the progress in various disciplines of bioengineering and biomaterials science.

The development of radioimmunoassay (RIA) by R.S. Yalow and S.A. Berson in 1959 opens up a new avenue in ultra sensitive analysis of trace substances in complex biological systems. In recognition of the enormous contributions of RIA to basic research in biology and to routine clinical tests in laboratory medicine, R.S. Yalow, the co-developer of RIA, was awarded, in 1977, the Nobel Prize for Medicine and Physiology. The basic principle of RIA is elegantly simple. It is based on a specific, competitive binding reaction between the analyte and the radio-labeled analog of the analyte for the specific antibody raised to the analyte. The combination of high specificity and affinity of an antibody molecule makes it a very versatile analytical reagent capable of reacting specifically with analytes at a very low concentration in a complex solution such as serum. The sensitivity of RIA is provided by using a radioactive tracer.

The aim of this book is to provide the researcher with important sample preparation strategies in a wide variety of analyte molecules, specimens, methods, and biological applications requiring mass spectrometric analysis as a detection end-point. In this volume we have compiled the contributions from several laboratories which are employing mass spectrometry for biological analysis. With the latest inventions and introduction of highly sophisticated mass spectrometry equipment sample preparation becomes an extremely important bottleneck of biomedical analysis. We have a goal of giving the reader several successful examples of sample preparation, development and optimization, leading to the success in analytical steps and proper conclusions made at the end of the day. This book is structured as a compilation of contributed chapters ranging from protocols to research articles and reviews. The main philosophy of this volume is that sample preparation methods have to be optimized and validated for every project, for every sample type and for every downstream analytical technique.
