Underpinnings of much of modern physics. It's heavy going in many parts, requiring at least an undergraduate degree in mathematics (one containing lots of group theory) to even vaguely follow it.

Operation is commutative:  $g_i g_j = g_j g_i$ . Obviously the center of an Abelian group is the group itself. The symmetry group  $C_4$  of the square is Abelian; the analogous group of the cube is an example of a non-Abelian group. In physics we often deal with groups (or subgroups of)  $GL(n, F)$ .
