That is, instead of compliance being part of a larger pattern of behavior as suggested by a personality perceptive, it may be how one evaluates the immediate ...

"Gordon Allport was an American psychologist, largely credited with the development of personality psychology. Allport is particularly known for the development of his trait theory of personality. With a strong religious and moral upbringing, Allport had a strong desire to integrate the scientific approach of psychology with a desire to better society, and advance the field of social ethics. In his trait theory, Allport argued that our behavior was determined by enduring qualities that could be measured, known as traits"--

Capturing a scientific change in thinking about personality and individual differences that has been building over the past 15 years, this volume stands at an important moment in the development of psychology as a discipline. Rather than viewing individual differences as merely the raw material upon which selection operates, the contributing authors provide theories and empirical evidence which suggest that personality and individual differences are central to evolved psychological mechanisms and behavioral functioning. The book draws theoretical inspiration from life history theory, evolutionary genetics, molecular genetics, developmental psychology, personality psychology, and evolutionary psychology, while utilizing the theories of the "best and the brightest" international scientists working on this cutting edge paradigm shift. In the first of three sections, the authors analyze personality and the adaptive landscape; here, the authors offer a novel conceptual framework for examining "personality assessment adaptations." Because individuals in a social environment have momentous consequences for creating and solving adaptive problems, humans have evolved "difference-detecting mechanisms" designed to make crucial social decisions such as mate selection, friend selection, kin investment, coalition formation, and hierarchy negotiation. In the second section, the authors examine developmental and life-history theoretical perspectives to explore the origins and development of personality over the

lifespan. The third section focuses on the relatively new field of evolutionary genetics and explores which of the major evolutionary forces--such as balancing selection, mutation, co-evolutionary arms races, and drift--are responsible for the origins of personality and individual differences. Existing as a seminal work in the newly emerging evolutionary psychology field, this book is a "must-read" for anyone invested in the development of psychology as a field.

Research results over the past decades have consistently demonstrated that a key reason why many second language learners fail--while some learners do better with less effort--lies in various learner attributes such as personality traits, motivation, or language aptitude. In psychology, these attributes have traditionally been called "individual differences." The scope of individual learner differences is broad--ranging from creativity to learner styles and anxiety--yet there is no current, comprehensive, and unified volume that provides an overview of the considerable amount of research conducted on various language learner differences, until now. Each chapter in this new volume focuses on a different individual difference variable. Besides a review of the relevant second language literature, Zoltán Dörnyei presents a concise overview of the psychological research involving each topic. A key concern for the author has been to define the various learner factors as measurable constructs and therefore the discussion includes a summary of the most famous tests and questionnaires in each domain. A wide range of readers will benefit from this book--students in linguistics, applied linguistics, modern languages, and psychology programs; second language teachers participating in in-service training courses; and researchers in second language acquisition and psychology.
