### Lecture 1: Introduction to Atmospheric Chemistry

The objective of atmospheric chemistry is to understand the factors that control the concentrations of chemical species in the atmosphere. In this book we will use three principal measures of atmospheric composition: mixing ratio, number density, and partial pressure. As we will see, each measure has its own applications.

From the phase diagram we find that the stable phase of water is liquid. The fact that the atmosphere contains water vapor simply means that it is not in equilibrium. Under these conditions water will condense to produce a liquid phase, and  $P_{H_2O}$  will decrease until the gas-liquid equilibrium line is reached.

Therefore, atmospheric chemistry is a study of how a molecule introduced into the atmosphere is altered by the oxidizing medium of the atmosphere and, in turn, how this alteration affects the atmospheric composition and atmospheric properties. Let us examine what can happen to a molecule that is introduced into the atmosphere.
