Experimental psychology is concerned with testing theories of human thoughts, feelings, actions, and beyond - any aspect of being human that involves the mind. This is a broad category that features many branches within it (e.g. behavioral psychology, cognitive psychology).

What is Experimental Psychology? - imotions

The Experimental Psychology analyses relationships between human behaviour and the mind. It is centred on fact-based and scientific research. This quiz has been designed to test your initial understanding of the field of experimental psychology and will allow you to learn about your base knowledge for the preparation of the exams.

Can You Pass This Experimental Psychology Test? - ProProfs

Experimental psychology utilizes scientific methods to answer these questions by researching the mind and behavior. Experimental psychologists conduct experiments to learn more about why people do certain things.

How Experimental Psychology Studies Behavior

You will explore cognitive psychology as an experimental science, as you consider the psychology of thinking and reasoning and the psychology of imagination and thinking visually. You will learn how to run an experiment, how to collect data and understand the science behind memory and behaviour through experiments.

Originally published during the early part of the twentieth century, the Cambridge Manuals of Science and Literature were designed to provide concise introductions to a broad range of topics. They were written by experts for the general reader and combined a comprehensive approach to knowledge with an emphasis on accessibility. An Introduction to Experimental Psychology by Charles S. Myers was first published in 1911 and reissued as this third edition in 1914. The volume discusses the typical research themes and methods of observation in experimental psychology at the time of publication.

"In 1946 I was faced with the problem of teaching a course in undergraduate experimental psychology with no available text seeming suitable for background reading. Therefore, I started to bring together certain materials to be mimeographed and issued to the students as a substitute for a text. These materials were revised and expanded from quarter to quarter until the present final draft was written. While I set up the objective of continuous unification of method and content, I must add quickly that I was unable to attain the objective completely. In mimeographed form the text has been used in a two-quarter course for which Elementary Statistics was a prerequisite, and in a year course where statistics was taught as an integral part of the methodology. I believe that the factual subject matter can be comprehended readily without a statistical knowledge, but a full appreciation of experimental design problems requires some statistical thinking."
