So the solution here, so the solution to a differential equation is a function, or a set of functions, or a class of functions. It's important to contrast this relative to a traditional equation. So let me write that down. So a traditional equation, maybe I shouldn't say traditional equation, differential equations have been around for a while.

$0)) = x(0;y)$; hence, $x(t+T;y) = x(t;y)$ for all $t \geq 0$. Given the existence of fixed points for the Poincaré map, one defines stability as below. Definition 5.31. p is a stable fixed point of P if for each $\epsilon > 0$ there is a $\delta > 0$ such that if $|x - p| < \delta$, then $|P^n(x) - p| < \epsilon$ for all $n \in \mathbb{N}$. Otherwise, the fixed point is unstable.

CLASSIFICATION BY ORDER The order of a differential equation (either ODE or PDE) is the order of the highest derivative in the equation. For example, is a second-order ordinary differential equation. First-order ordinary differential equations are occasionally written in differential form $M(x,y)dx + N(x,y)dy = 0$.
