MRI is a mainstay in the assessment of low back pain and degenerative disease of the lumbar spine. This paper has reviewed the common findings affecting the vertebral bodies, intervertebral discs, facet joints, and ligamentum flava, as well as the combined effects of these changes on the spinal canal and neural foramina.

MRI Degenerative Disease of the Lumbar Spine: A Review

Introduction: Lower back pain secondary to degenerative disc disease is a condition that affects young to middle-aged persons with peak incidence at approximately 40 y. MRI is the standard imaging modality for detecting disc pathology due to its advantage of lack of radiation, multiplanar imaging capability, excellent spinal soft-tissue contrast and precise localization of intervertebral discs changes.

MRI evaluation of lumbar disc degenerative disease

In particular, MRI provides a very sensitive method for examining degenerative phenomena of the spine, even in the initial stages of the disease lifetime [1 – 3, 5 – 9]. However, traditional MRI of patients with low back pain does not always enable clear identification of pain aetiology. In our experience, T2-weighted sequences with fat saturation and, when indicated, T1-weighted sequences with fat saturation after intravenous administration of contrast medium provide a more sensitive ...

Although textbooks that discuss abnormalities of the spine often focus on the vertebral disk unit (disk herniation and/or osteomyelitis) and degenerative stenosis (which, based on percentages for typical disease patterns, is appropriate for focused learning and reviewed in the textbook), MRI of Degenerative Disease of the Spine provides additional value by illustrating often-overlooked (neglected) diseases of the spine (ie, abnormality involving interapophyseal joints, spinal ligaments, and ...

Neurodegenerative MRI brain (an approach) Imaging of the brain in patients with suspected neurodegenerative conditions is common and challenging, as in patients with subtle and equivocal signs and symptoms, the imaging findings are also often subtle and equivocal. In many instances, by the time imaging findings are clear cut, then the patient has declared themselves clinically, and the diagnosis is already established or at least strongly suggested.

Degenerative disc disease. William O. Reed, Jr. MD and Dr Matt Skalski et al. Degenerative disc disease (DDD) is an exceedingly common entity in the spine, encountered with increasing frequency throughout life and becoming almost universal in late adulthood to a varying degree. It is related to a combination of biomechanical stresses and genetic predisposition which alter the metabolic and structural integrity of the intervertebral disc.

Chronic inflammatory demyelinating polyneuropathy (CIPD) is an acquired demyelinating disease of the peripheral nerve roots. Patients typically present with gradual onset of weakness and loss of reflexes. The clinical presentation can mimic Guillian-Barre syndrome, but CIPD has a more chronic course.
