According to Colman (1988), Harold Pinter's play The Caretaker illustrates the inadequacy of the stable set, a solution concept of cooperative game theory proposed by von Neumann and Morgenstern (1944). We challenge this illustration by pointing out that it is at variance with Pinter scholars' interpretation of the play.

By Charles C Pinter. Suitable for upper-level undergraduates, this accessible approach to set theory poses rigorous but simple arguments. Each definition is accompanied by commentary that motivates and explains new concepts. Starting with a repetition of the familiar arguments of elementary set theory, the level of abstract thinking gradually rises for a progressive increase in complexity.

A historical introduction presents a brief account of the growth of set theory, with special emphasis on problems that led to the development of the various systems of axiomatic set theory. Subsequent chapters explore classes and sets, functions, relations, partially ordered classes, and the axiom of choice.

The complement of a finite set in R is open. If A is the union of the infinite sequence  $x_n = 1/n$ ,  $n = 1, 2, \dots$ , together with its limit 0 then the complement  $R-A$  is open. Any union of open intervals is an open set. The preceding examples are special cases of this. The converse statement is also true: every open set O is a union

Pinter's Set Theory Exercise 1.7.6: Let G and H be graphs. Prove that if G and H are sets, then G inverse and GoH are sets. 0 I've managed to do a proof of this by using the previous exercise that shows the domain and range of G are both sets.
