A honey bee (also spelled honeybee) is a eusocial flying insect within the genus *Apis* of the bee clade, all native to Eurasia but spread to four other continents by human beings. They are known for their construction of perennial colonial nests from wax, the large size of their colonies, and surplus production and storage of honey, distinguishing their hives as a prized foraging target of many ...

In Britain there are around 65 species of bee in the genus *Andrena*, making it the largest bee genus in Britain. These bees are quite variable in size ranging from 5-17mm long but all nest in the soil. These bees have short pointed tongues and are characterised by the grooves (facial fovea) running down the inside of their eyes which is more or ...

It is, without a doubt, the most rare of North American bee species, assuming it is still living. In regard to *Sinomelecta* , it may be tantalizing to suspect that *Sinomelecta oreina* , with its various external features reminiscent of Palearctic *Melecta* [e.g., *Melecta* (*Melecta*) *emodi* Baker], is merely an autapomorphic species of that genus with its two submarginal cells and reduced flagellar count in males.
